

## ABSTRACT

An expert system, usable by layman in the field of ergonomics, that provides ergonomic programs for providing, in turn, reports including those covering controls for actual or potential work-site specific, ergonomic related hazard exposures and injuries, as well as other related reports. The system includes a web-server as well as the Internet and associated connecting devices, and a computer operated by a user. The web-server includes an interactive web-site and certain software that proposes certain questions to the user, which when answered, will identify the specific work-site of interest and the work-site conditions. When so identified, the web-server automatically accesses the appropriate ergonomics program. Extracted information is sent to the user in the form of one or more reports.
